(a) Bit flip rate Γ_X vs cat size
lose one photon
lose two photons
$-\lambda_{\text{odd}}$ (eigenvalue)
time-domain fit
$\alpha = 2.1$: $\Gamma_X = 3.8 \times 10^{-7}\,\mu\text{s}^{-1}$
$1/\Gamma_X \approx 2.6$ s
brute force
reaches here
Γ_X (μs^{-1})
α^2 (mean photon number)
(b) Scaling with κ_a
$\Gamma_X \propto \kappa_a^2$
$\Gamma_X \propto \kappa_a$
$d\ln\Gamma_X / d\ln\kappa_a$
α^2
